

中文題目:潛水作業後引發自發性縱膈腔氣腫

英文題目: Spontaneous Pneumomediastinum after Scuba Diving

作者: 楊宗翰, 林承志, 湯旭南

服務單位: 國軍高雄總醫院左營分院內科部胸腔內科

Figure Legend

A 20-year-old male soldier who serves in the Marine Underwater Operations Unit and he underwent scuba diving training recent two weeks. He began to suffer from progressive sub-sternal pain but without dyspnea for three days. Physical examination showed no chest wall discomfort, but right low neck tenderness. The chest x-ray revealed subcutaneous emphysema over the right low neck. The computed tomography of chest was performed with diagnosis of spontaneous pneumomediastinum confirmed. Symptomatic treatment was prescribed to patient with observation and he was discharged with resolution of clinical symptoms and free of subcutaneous emphysema.
