Background:

Nocardial brain abscess is a rare central nervous system infection which associated with high morbidity and mortality. It mostly presents as opportunistic infection in immunocompromised patients but also occurs in otherwise healthy individuals.

Case description:

A case with myasthenia gravis treated with steroid. He initially presented as Influenza A virus infection with secondary bacterial infection. Follow-up data showed re-infection and further survey reported brain abscess. He then received craniotomy and antibiotic treatment.

Discussion:

We discussed about the epidemiology and presentation of Nocardia infection focused on brain abscess and treatment of Nocardial brain abscess.
